

Nice to improve in next versions:

1. There is no way to exit the 'add a user' without adding a user.
2. Once a username has been added there is no way to correct it
3. Once a password has been typed, there is no way to correct it or validate it

Notes:

1. This is a hidden option (like every good game has!) to enter, simply select 9 on main game selection
2. The sky is the limit for innovations and options. Yet I implemented very many! And it helped me to test the program
3. TBD: Add indication that a setting has been replaced
